## Characteristics of each of the six cohorts and their participants

## CEANS (Cardiovascular Effects of Air Pollution and Noise in Stockholm)

All participants resided in Stockholm County, Sweden. The cohort is comprised of four sub-cohorts: The Screening Across the Lifespan Twin Study (SALT) sampled 7,043 individuals from the Swedish Twin Register born 1958 and earlier, who lived in Stockholm County ${ }^{1}$. The Stockholm Diabetes Preventive Program (SDPP) is a population-based prospective study of 7,949 subjects aged 35-54 years ${ }^{2}$. The Stockholm cohort of 60 -year-olds (Sixty) sub-cohort consists of a random population sample of one-third of all men and women living in Stockholm County turning 60 years between August 1997 and March $1999^{3}$. Lastly, The Swedish National Study on Aging and Care in Kungsholmen (SNAC-K) consists of randomly sampled individuals 60 years old and over from a central area (Kungsholmen) in Stockholm ${ }^{4}$.

[^0]EPIC-NL (European Prospective Investigation into Cancer and Nutrition, the Netherlands) The EPIC-NL ${ }^{8}$ combines two Dutch EPIC-cohorts: The Monitoring Project on Risk Factors and chronic diseases in the Netherlands (MORGEN) cohort which consists of a general population sample aged 20-59 years from three Dutch towns (Amsterdam, Doetinchem and Maastricht). The Prospect is a prospective cohort study among women aged 49-70, residing in the city of Utrecht or its vicinity, who participated in the nationwide Dutch breast cancer screening programme between 1993 and 1997.

${ }^{\mathrm{b}}$ Covariates which used the main model: age, sex, calendar year of baseline, smoking status, employment status, and 2001 mean income at the neighborhood level
${ }^{c}$ EUR per 1,000 . Neighborhood defined as a neighborhood of a larger city

## VHM\&PP (Vorarlberg Health Monitoring and Prevention Programme)

The VHM\& $\mathrm{PP}^{9}$ is a population-based cohort recruited among all adults of the province of Vorarlberg, Austria.

| Characteristics | VHM\&PP <br> Vorarlberg, Austria |
| :---: | :---: |
| Enrolled, N | 181,350 |
| Pooled, N | 170,250 |
| Exclusions ${ }^{\text {a }}$, N | 4,892 |
| Missing on covariates ${ }^{\text {b }}$, N | 16,362 |
| Included, N | 148,996 |
| Baseline period, year | 1985-2005 |
| End of follow-up | 31-12-2014 |
| Person-year | 3,121,637.2 |
| Follow-up time, year | 21 |
| Liver cancer, N | 292 |
| Baseline age, year (Mean $\pm$ SD) | $41.5 \pm 14.9$ |
| Age categories, N (\%) |  |
| $<65$ years old | 137,261 (92.1) |
| $\geq 65$ years old | 11,735 (7.9) |
| Women, N (\%) | 82,498 (55.4) |
| Smoking status, N (\%) |  |
| Never smoker | 105,426 (70.8) |
| Previous smoker | 8,792 (5.9) |
| Current smoker | 34,778 (23.3) |
| Unemployed, N (\%) | 42,909 (28.8) |
| Intake of alcohol, N (\%) |  |
| Low ( $<4 \mathrm{~g} /$ day) | - |
| Medium (4-15 g/day) | - |
| High (15> g/day) | - |
| Education levels, N (\%) |  |
| Low level | - |
| Medium level | - |
| High level | - |
| Mean income at neighborhood level in $2001^{\text {c }}$ (Mean $\pm$ SD) | $22.9 \pm 1.7$ |
| $\mathrm{NO}_{2}, \mu \mathrm{~g} / \mathrm{m}^{3}$ (Mean $\pm$ SD) | $22 \pm 5.3$ |
| $\mathrm{PM}_{2.5}, \mu \mathrm{~g} / \mathrm{m}^{3}$ (Mean $\pm$ SD) | $15.7 \pm 2.6$ |
| BC, $10^{-5} / \mathrm{m}$ (Mean $\pm$ SD) | $1.6 \pm 0.3$ |
| $\mathrm{O}_{3}, \mu \mathrm{~g} / \mathrm{m}^{3}$ (Mean $\pm$ SD) | $92.6 \pm 3.6$ |

Abbreviation: N , number; SD, standard deviation; $\mathrm{NO}_{2}$, nitrogen dioxide; $\mathrm{PM}_{2.5}$, particulate matters with aerodynamic diameters of less than $2.5 \mu \mathrm{~m} ; \mathrm{BC}$, black carbon; $\mathrm{O}_{3}$, ozone.
${ }^{\text {a }}$ Due to cancer before baseline or missing information on exposure data, the prevalent cancer status, or the date of start or end of follow-up
${ }^{b}$ Covariates which used the main model: age, sex, calendar year of baseline, smoking status, employment status, and 2001
mean income at the neighborhood level
${ }^{\mathrm{c}}$ EUR per 1,000 . Neighborhood defined as municipality

Table S1. Pearson correlations per each cohort between annual mean concentration to $\mathrm{NO}_{2}, \mathrm{PM}_{2} .5, \mathrm{BC}$, and $\mathrm{O}_{3}$ among participants with full information in the main model ( $\mathrm{N}=\mathbf{3 3 0}, 064$ ).
