

Supplementary Table. *In vitro* and *in vivo* studies on NET/METs in different stages of TB disease

Effects/findings	ET type	Stimulus	<i>In vivo/ in vivo</i>	Associated mechanisms	Disease stage	Reference
<ul style="list-style-type: none"> Protective effect of NETs in trapping <i>M.tb</i>. However, NETs correlates with disease severity suggesting a detrimental effect as well. <i>M.tb</i>-activated neutrophils acquired highly clustered NETs, more than those formed upon PMA stimulation. <i>M.tb</i>-induced NET formation is regulated by the NADPH-oxidase as well as NE. Upon <i>M.tb</i> stimulation, NETs bind and concentrate Hsp72 to the NET strands. Hsp72 is later used for the activation of macrophages triggering local cytokine production: IL-6, TNF-α, IL-1β and IL-10. 	NET	<i>M.tb</i>	<i>In vitro</i> (human neutrophils and monocytes isolated from healthy blood donors)	<ul style="list-style-type: none"> Phagocytosis ROS 	Healthy donors	(Braian et al., 2013)
<ul style="list-style-type: none"> NETs are present in MPO positive neutrophilic lung lesions from infected C3HeB/FeJ mice as well as in necrotic lung lesions from patients with ATB. Neutrophils isolated from patients with active TB over-express type I IFN-inducible genes. Increased type I IFN signaling induces pulmonary NETosis and promotes mycobacterial growth in the absence of GM-CSF. 	NET	<i>M.tb</i>	<i>In vivo</i> (infected C3HeB/FeJ TB-susceptible mice, and ATB patients)	-	ATB	(Moreira-Teixeira et al., 2020)
<ul style="list-style-type: none"> Patients with ATB show an aberrantly high level of low density granules that could be associated to increased NET release together with increased levels of ROS. 	NET	<i>M.tb</i>	<i>In vitro</i> (LDGs and NDGs from ATB peripheral venous blood)	<ul style="list-style-type: none"> ROS 	ATB	(Su et al., 2019)
<ul style="list-style-type: none"> ATB patients showed high levels of NETs and NE that correlates with plasma levels of nucleosomes. 	NET	-	<i>In vivo</i> (plasma from ATB patients)	-	ATB and healthy donors	(van der Meer et al., 2017)

<ul style="list-style-type: none"> NETs were observed as early as 30 min post-infection and contained active MPO and ROS. NETs size increased in time and reached a maximum level of expression at 6–8h after infection. All life <i>M.tb</i>, inactivated <i>M.tb</i>, lipid components from <i>M.tb</i>, <i>M. bovis</i> BCG and <i>M. smegmatis</i> were shown to induce the formation of NETs. 	NET	<i>M.tb</i>	<i>In vivo</i> and <i>invitro</i> (blood and skin samples from guinea pigs)	<ul style="list-style-type: none"> ROS 	Early stage of infection (0-6h)	(Filio-Rodríguez et al., 2017)
<ul style="list-style-type: none"> <i>M.tb</i> induces NETosis. Mycobacterial antigens ESAT-6 and CFP-10 induced NETosis. 	NET	<i>M.tb</i>	<i>In vivo</i> (sera from ATB patients)	<ul style="list-style-type: none"> ROS Phagocytosis 	ATB	(Rojas-Espinosa et al., 2021)
<ul style="list-style-type: none"> Rv0888 sphingomyelinase activity was found to induce the formation of NETs <i>in vitro</i> and <i>in vivo</i>. Those NET structures observed in the lung tissue lacked mesh-like extracellular chromatin structures, possibly due to the space limitations of the lung parenchyma. Increased levels of IL-6, TNF-α, and IL-1β were associated with NETs-mediated lung injury. 	NET	Recombinant <i>M. smegmatis</i> Rv0888	<i>In vivo</i> (C57BL/6 mice)	<ul style="list-style-type: none"> Apoptosis Phagocytosis 	ATB	(Dang et al., 2018)
<ul style="list-style-type: none"> Increased levels of plasma MPO-DNA, MPO, and NE were significantly higher in patients with ATB compared to subjects with LTBI and healthy controls, and correlated with mycobacterial burden. 	NET	<i>M.tb</i>	<i>In vivo</i> (human TB patients)	-	ATB, LTBI	(Schechter et al., 2017)
<ul style="list-style-type: none"> <i>M.tb</i> induces NET formation which does not adhere to the shape of the neutrophil nuclei. MMP-8 and MMP-9 are up-regulated in TB patients and caused matrix destruction. Similar levels of MMP-8 were found after stimulation with CoMTB-stimulated neutrophils. 	NET	<i>M.tb</i>	<i>In vitro</i> (neutrophils infected with <i>M.tb in vitro</i>) and <i>in vivo</i> (respiratory samples)	-	ATB	(Ong et al., 2015)

<ul style="list-style-type: none"> Elevated levels of MMP-8 in TB sputum samples. α1AT is an important negative modulator of the NET activity NET formation was the main neutrophil's mechanism of action responsible for LTD due to TB infection in the studied cohort. Patients with higher cit-H3 levels exhibited increased cavity formation. Cit-H3 is a potent marker for NET formation and therefore probably a marker for LTD in TB. 	NET	<i>M.tb</i>	<i>In vivo</i> (serum from patients with pulmonary TB)	<ul style="list-style-type: none"> ROS Phagocytosis 	ATB	(de Melo et al., 2019)
<ul style="list-style-type: none"> NETs induced by BCG contained active LL-37 NET formation upon stimulation with BCG is ROS-dependent NET cathelicidin is internalized by human macrophages through active endocytosis and is then transported into macrophage lysosomes. 	NET	BCG	<i>In vitro</i> (human monocyte-derived macrophages and neutrophils)	<ul style="list-style-type: none"> ROS Phagocytosis 	Healthy blood donors	(Stephan et al., 2016)
<ul style="list-style-type: none"> ALF-exposed <i>M.tb</i> has limited ability to induce NET formation. 	NET	<i>M.tb</i>	Human alveolar lining fluid and neutrophils	-	Healthy blood donors	(Arcos et al., 2015)
<ul style="list-style-type: none"> METs by <i>M.tb</i>-stimulated macrophages structure were similar to those resulting from activated neutrophils and its formation was regulated by elastase activities. MET formation was more efficient by mycobacterial clumps. IFN-γ was found to enhance <i>M.tb</i>-induced METs which depends on ESX-1. 	MET	<i>M.tb</i> (H37Rv and Δ ESX-1)	<i>In vitro</i> (THP-1 macrophages) and <i>in vivo</i> (human macrophages from healthy donors)	<ul style="list-style-type: none"> Cell death, elastase involved 	Healthy blood donors	(Wong and Jacobs, 2013)
<ul style="list-style-type: none"> Macrophages infected with non-cording bacteria produced relatively less METs compared to those released from cording-<i>M.tb</i>. METs by cording-<i>M.tb</i> were formed either in the form of threads or meshwork MET formation was shown not to be ROS-dependent in hMDMs. ESAT-6 is essential for MET formation in <i>M.tb</i>-infected macrophages. 	MET	<i>M.tb</i> (H37Rv and (H37Rv - Δ ESAT-6)	<i>In vitro</i> (hMDMs)	<ul style="list-style-type: none"> Independent of ROS 	Healthy blood donors	(Kalsum et al., 2017)

hN, human neutrophils; LDG, low density granulocytes; NDG, normal density granulocytes; ALF, human alveolar lining fluid; *M.tb*, *Mycobacterium tuberculosis*; TB, tuberculosis; BCG, bacillus Calmette-Guérin; LTBI, latent

tuberculosis infection; ATB, active tuberculosis;; ETs, extracellular traps; ROS, reactive oxygen species; NETs, neutrophil extracellular traps; METs, macrophage extracellular traps; ESX-1, ESAT-6 secretion system-1; NE, neutrophil elastase; PMA, phorbol 12-myristate 13-acetate; hMDMs, human monocyte-derived macrophages; GM-CSF, granulocyte-macrophage colony-stimulating factor; CoMTB, conditioned media from *M.tb*-infected monocytes; α 1AT, alpha-1-antitrypsin; LTD, lung tissue damage
