

### Appendix 3 - Screening and protocol use in each geographical region.

Table indicating which anatomical structures are formally assessed in the first trimester by those hospital trusts using a protocol in each region. Each region is represented anonymously represented by the letter A to I.\*For one unit in Region D, responses indicated that early anomaly screening was routinely offered with a formal anatomical protocol in use, however this protocol was not made available and therefore could not be assessed. The nine available protocols for Region D were therefore included in the analysis. \*\*For one unit in Region I, responses indicate that early anomaly screening was routinely offered without a formal protocol in use and this was not made available for analysis. The three available protocols for Region I were therefore included in the analysis. ^Of the 83 units included in this analysis, only 81 protocols were available for analysis.
